成绩:

第 1 题 得分: ______. 令变量 x, y, z 满足方程 f(x, y, z) = 0, w 为 x, y, z 中任意两个变量的函数. 证明:

- 1) $\left(\frac{\partial x}{\partial y}\right)_w \left(\frac{\partial y}{\partial z}\right)_w = \left(\frac{\partial x}{\partial z}\right)_w$
- 2) $\left(\frac{\partial x}{\partial y}\right)_z \left(\frac{\partial y}{\partial x}\right)_z = 1$
- 3) $\left(\frac{\partial x}{\partial y}\right)_z \left(\frac{\partial y}{\partial z}\right)_x \left(\frac{\partial z}{\partial x}\right)_y = -1$

并用理想气体的状态方程验证 2) 和 3), 其中 x=P, y=T, z=V.

证: 1) 将w写作x, y的函数

$$w = w(x, y) \tag{1}$$

并取微分,有

$$dw = \left(\frac{\partial w}{\partial x}\right)_y dx + \left(\frac{\partial w}{\partial y}\right)_x dy. \tag{2}$$

令上式中 dw = 0, 得

$$\left(\frac{\partial x}{\partial y}\right)_w = -\frac{\left(\frac{\partial w}{\partial y}\right)_x}{\left(\frac{\partial w}{\partial x}\right)_y}.$$
 (3)

对式 f(x,y,z) = 0 取微分,有

$$df = \left(\frac{\partial f}{\partial x}\right)_{y,z} dx + \left(\frac{\partial f}{\partial y}\right)_{x,z} dy + \left(\frac{\partial f}{\partial z}\right)_{x,y} dz = 0,$$
(4)

从而可将 dx 表示为

$$dx = -\frac{\left(\frac{\partial f}{\partial y}\right)_{x,z} dy + \left(\frac{\partial f}{\partial z}\right)_{x,y} dz}{\left(\frac{\partial f}{\partial x}\right)_{y,z}}.$$
 (5)

将上式代入式 (2), 得

$$dw = -\left(\frac{\partial w}{\partial x}\right)_{y} \frac{\left(\frac{\partial f}{\partial y}\right)_{x,z} dy + \left(\frac{\partial f}{\partial z}\right)_{x,y} dz}{\left(\frac{\partial f}{\partial x}\right)_{x,z}} + \left(\frac{\partial w}{\partial y}\right)_{x} dy. \tag{6}$$

令上式中 dw = 0, 得

$$\left(\frac{\partial y}{\partial z}\right)_{w} = \frac{-\left(\frac{\partial w}{\partial x}\right)_{y}\left(\frac{\partial f}{\partial z}\right)_{x,y}}{\left(\frac{\partial w}{\partial x}\right)_{y}\left(\frac{\partial f}{\partial y}\right)_{x,z} - \left(\frac{\partial w}{\partial y}\right)_{x}\left(\frac{\partial f}{\partial x}\right)_{y,z}}.$$
(7)

由式 (4), 也可将 dy 表为

$$dy = -\frac{\left(\frac{\partial f}{\partial x}\right)_{y,z} dx + \left(\frac{\partial f}{\partial z}\right)_{x,y} dz}{\left(\frac{\partial f}{\partial y}\right)_{x,z}}.$$
 (8)

将上式代入式 (2), 得

$$dw = \left(\frac{\partial w}{\partial x}\right)_y dx - \left(\frac{\partial w}{\partial y}\right)_x \frac{\left(\frac{\partial f}{\partial x}\right)_{y,z} dx + \left(\frac{\partial f}{\partial z}\right)_{x,y} dz}{\left(\frac{\partial f}{\partial y}\right)_{x,y}}.$$
 (9)

令上式中 dw = 0 得

$$\left(\frac{\partial x}{\partial z}\right)_{w} = \frac{\left(\frac{\partial w}{\partial y}\right)_{x} \left(\frac{\partial f}{\partial z}\right)_{x,y}}{\left(\frac{\partial w}{\partial x}\right)_{y} \left(\frac{\partial f}{\partial y}\right)_{x,z} - \left(\frac{\partial w}{\partial y}\right)_{x} \left(\frac{\partial f}{\partial x}\right)_{y,z}} \tag{10}$$

式 (3) 与 (7) 相乘恰好等于式 (10),

$$\left(\frac{\partial x}{\partial y}\right)_{w} \left(\frac{\partial y}{\partial z}\right)_{w} = \frac{\left(\frac{\partial w}{\partial y}\right)_{x} \left(\frac{\partial f}{\partial z}\right)_{x,y}}{\left(\frac{\partial w}{\partial x}\right)_{y} \left(\frac{\partial f}{\partial y}\right)_{x} - \left(\frac{\partial w}{\partial y}\right)_{x} \left(\frac{\partial f}{\partial z}\right)_{y,z}} = \left(\frac{\partial x}{\partial z}\right)_{w}, \tag{11}$$

得证.

2) 令 z 保持不变,即在式 (4) 中令 dz = 0,得

$$df = \left(\frac{\partial f}{\partial x}\right)_{y,z} dx + \left(\frac{\partial f}{\partial y}\right)_{x,z} dy = 0, \tag{12}$$

从而

$$\left(\frac{\partial x}{\partial y}\right)_z = -\frac{\left(\frac{\partial f}{\partial y}\right)_{x,z}}{\left(\frac{\partial f}{\partial x}\right)_{y,z}},$$
(13)

$$\left(\frac{\partial y}{\partial x}\right)_z = -\frac{\left(\frac{\partial f}{\partial x}\right)_{y,z}}{\left(\frac{\partial f}{\partial y}\right)_{x,z}}.$$
(14)

上面两式相乘,得

$$\left(\frac{\partial x}{\partial y}\right)_{x} \left(\frac{\partial y}{\partial x}\right)_{x} = 1. \tag{15}$$

3) 令式 (4) 中的 dx = 0, 得

$$\left(\frac{\partial y}{\partial z}\right)_x = -\frac{\left(\frac{\partial f}{\partial z}\right)_{x,y}}{\left(\frac{\partial f}{\partial y}\right)_{x,z}}.$$
(16)

令式 (4) 中的 dy = 0, 得

$$\left(\frac{\partial z}{\partial x}\right)_{y} = -\frac{\left(\frac{\partial f}{\partial x}\right)_{y,z}}{\left(\frac{\partial f}{\partial z}\right)_{x,y}}.$$
(17)

式 (13), (16) 和 (17) 相乘, 得

$$\left(\frac{\partial x}{\partial y}\right)_z \left(\frac{\partial y}{\partial z}\right)_x \left(\frac{\partial z}{\partial x}\right)_y = -1. \tag{18}$$

理想气体的状态方程为

$$PV = nRT. (19)$$

验证 2):

$$\begin{cases}
\left(\frac{\partial P}{\partial T}\right)_V = \frac{nR}{V}, \\
\left(\frac{\partial T}{\partial P}\right)_V = \frac{V}{nR},
\end{cases} (20)$$

$$\Longrightarrow \left(\frac{\partial P}{\partial T}\right)_V \left(\frac{\partial T}{\partial P}\right)_V = 1. \tag{21}$$

验证 3):

$$\begin{cases}
\left(\frac{\partial P}{\partial T}\right)_{V} = \frac{nR}{V}, \\
\left(\frac{\partial T}{\partial V}\right)_{P} = \frac{P}{nR}, \\
\left(\frac{\partial V}{\partial P}\right)_{T} = -\frac{nRT}{P^{2}},
\end{cases}$$

$$\Rightarrow \left(\frac{\partial P}{\partial T}\right)_{V} \left(\frac{\partial T}{\partial V}\right)_{P} \left(\frac{\partial V}{\partial P}\right)_{T} = -\frac{nRT}{VP} = -1.$$
(23)

$$\Longrightarrow \left(\frac{\partial P}{\partial T}\right)_V \left(\frac{\partial T}{\partial V}\right)_P \left(\frac{\partial V}{\partial P}\right)_T = -\frac{nRT}{VP} = -1. \tag{23}$$

第 2 题 得分: ______. 假设热容量 C_V 为常数,证明理想气体绝热过程中的下列关系:

- 1) $PV^{\gamma} =$ 常数
- 2) $TV^{\gamma-1} = 常数$
- 3) $PT^{\frac{\gamma}{1-\gamma}} = 常数$

其中 $\gamma \equiv C_P/C_V$, 并计算理想气体从初态 (P_1, V_1) 到末态 (P_2, V_2) 所做的功.

解: 1) 由热力学第一定律,

$$dU = \delta W + \delta Q \tag{24}$$

在绝热过程中,气体与外界无热量交换, $\delta Q=0$,而外界对气体所做的功为 $\delta W=-P\mathrm{d}V$. 对于理想气体, 由焦耳定律知,内能的微分可表为 $dU = C_V dT$. 从而式 (24) 可化为

$$C_V dT + P dV = 0. (25)$$

将理想气体的物态方程 PV = nRT 全式进行微分,得

$$P \, \mathrm{d}V + V \, \mathrm{d}P = nR \, \mathrm{d}T. \tag{26}$$

由于定压热容 C_P 和定容热容 C_V 之差为 $C_P - C_V = nR$, 上式可化为

$$P dV + V dp = (C_P - C_V) dT = (\gamma - 1)C_V dT,$$
 (27)

其中 $\gamma = C_P/C_V$. 联立式 (25) 和 (27), 消去 C_V , 得

$$V dP + \gamma P dV = 0, \tag{28}$$

即

$$\frac{\mathrm{d}P}{P} = -\gamma \frac{\mathrm{d}V}{V}.\tag{29}$$

在温度变化范围较小的情况下,可将 γ 视为常数,对上式积分,得

$$PV^{\gamma} = 常数. \tag{30}$$

2) 由理想气体的状态方程 pV = nRT, P 可表为

$$P = \frac{nRT}{V}. (31)$$

将上式代入式 (30),得

$$TV^{\gamma-1} = 常数. (32)$$

3) 由理想气体的状态方程 pV = nRT, V 可表为

$$V = \frac{nRT}{P}. (33)$$

将上式代入式 (30),得

$$P^{1-\gamma}T^{\gamma} = \sharp \mathfrak{A}. \tag{34}$$

取上式的 $\frac{1}{1-\gamma}$ 次方,得

$$pT^{\frac{\gamma}{1-\gamma}} = \sharp \mathfrak{Z}. \tag{35}$$

理想气体从初态 (P_1, V_1) 到末态 (P_2, V_2) 对外界所做的功为

$$W = \int_{V_1}^{V_2} P \, dV = C \int_{V_1}^{V_2} \frac{dV}{V^{\gamma}} = \frac{C}{\gamma - 1} \left(\frac{1}{V_2^{\gamma - 1}} - \frac{1}{V_1^{\gamma - 1}} \right)$$
 (36)

其中 C 为常数,

$$P_1 V_1^{\gamma} = P_2 V_2^{\gamma} = C. \tag{37}$$

故上式可化为

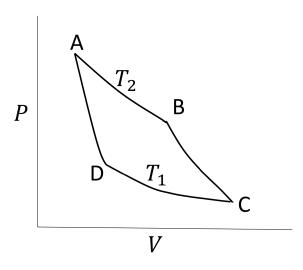

$$W = \frac{P_2 V_2 - P_1 V_1}{\gamma - 1}. (38)$$

第 3 题 得分: . 理想气体的 Carnot 循环: $A \to B \to C \to D \to A$

- 等温过程: $A \to B$ (与高温热源接触) $C \to D$ (与低温热源接触)
- 绝热过程: $B \to C$, $D \to A$.

假设热容量为常数,证明循环效率为

$$\eta = 1 - \frac{T_1}{T_2}.$$

证: 等温过程 $A \rightarrow B$ 中, 外界对气体做的功为

$$W_{A\to B} = -\int_{V_A}^{V_B} P \, dV = -RT_1 \int_{V_A}^{V_B} \frac{dV}{V} = -RT_1 \ln \frac{V_B}{V_A}.$$
 (39)

等温过程中理想气体的内能不变,故由热力学第一定律可知,气体从高温热源吸收的热量为

$$Q_1 = -W_{A \to B} = RT_1 \ln \frac{V_B}{V_A}. \tag{40}$$

同理,等温过程 $C \rightarrow D$ 中,气体向低温热源释放的热量为

$$Q_2 = RT_2 \ln \frac{V_C}{V_D}. (41)$$

绝热过程 $B \to C$ 和 $D \to A$ 中,气体与外界均无热量交换,因此,在一个 Carnot 循环中,气体净吸收的热量为

$$Q = Q_1 - Q_2 = RT_1 \ln \frac{V_B}{V_A} - RT_2 \ln \frac{V_C}{V_D}.$$
 (42)

一个 Carnot 循环后,气体回到原来的状态,故内能变化为零,由热力学第一定律知,在整个循环中,气体对外做的净功为

$$W = Q = RT_1 \ln \frac{V_B}{V_A} - RT_2 \ln \frac{V_C}{V_D}.$$
 (43)

因为过程 $B \to C$ 和 $D \to A$ 绝热,故有

$$T_1 V_B^{\gamma - 1} = T_2 V_C^{\gamma - 1},$$
 (44)

$$T_2 V_D^{\gamma - 1} = T_1 V_A^{\gamma - 1}. (45)$$

上面两式联立消去 T_1 和 T_2 , 得

$$\frac{V_B}{V_A} = \frac{V_C}{V_D}. (46)$$

因此,

$$W = R(T_1 - T_2) \ln \frac{V_B}{V_A}.$$
 (47)

在整个循环中,气体从高温热源吸收了热量 Q_1 ,对外做功 W,故循环效率为

$$\eta = \frac{W}{Q_1} = \frac{R(T_1 - T_2) \ln \frac{V_B}{V_A}}{RT_1 \ln \frac{V_B}{V_A}} = 1 - \frac{T_2}{T_1}.$$
 (48)
